Abstract (en)

[origin: EP1679665A1] The method involves storing a biometric reference parameter of at least one user in a personal mobile station such as a mobile telephone (1). The user orders the desired object or service from a remote server (6) via a communication network using the mobile station. An actual biometric parameter is detected by a sensor of the object or service provider and is compared with the saved reference parameter. If the comparison is successful, access to the object or service is permitted. Independent claims also cover a system for obtaining access to an object or service.
