Abstract (en)

A method for assigning at least one parameter to at least one transmission channel at an interface between nodes, involves evaluating the control plane terminal data and establishing which at least one transmission channel changes its state from inactive to active for the user plane terminal data within a specifiable time period followed by assigning the at least one parameter to the at least one transmission channel for the user plane terminal data. An independent claim is included for a device for allocating at least one parameter to at least one transmission channel.
