Abstract (en)
[origin: WO2005033458A1] The invention relates to a frame assembly (101) comprising profiled frame pieces for a hinged unit. The frame pieces are of the type which has a raised part constituting a shoulder (14) so arranged as to be in contact with the hinged unit in a closed position. The frame assembly (101), when in a position for use, consists of a first long piece (1) extending vertically in the Y-direction and a sill (4) extending horizontally in the X-direction. The invention is characterized in that the long piece (1) is executed with a plane first end section (5), in conjunction with which the sill (4) consists of an inclined top part (27), where a tangent to the inclined top part (27) forms an angle alpha with the horizontal plane, in conjunction with which a wedge device (25) is arranged between the plane first end section (5) and the inclined top part (27).
