Abstract (en)

[origin: WO2005043259A1] A clockwork item has a frame (3) within which a watch container (7, 8, 9) is reversibly mounted. The watch container (7, 8, 9) can rotate inside the frame (3) about a given axis (22) which extends through the side (24) of the watch container (7, 8, 9) and the inner sidewall (25) of the frame (3). In order to reduce the gap between the frame (3) and the watch container (7, 8, 9), the side (24) of the watch container (7, 8, 9) and the inner sidewall (25) of the frame (3) substantially form part of the same surface of revolution about the given axis (22).
