Abstract (en)

[origin: EP1681403A2] The present invention refers to an equipment for the construction of modular equipped walls, characterised in that it makes use of a spacing template basically consisting in a metal section with a large longitudinal stiffening rib and also provided with regularly spaced identical series of through holes used to fix additional modules on the front of the template (such as, for example: cover panels, shelves or object-holding compartments, additional bearing sections) and corresponding spacers on the back of the template used to fix it on the wall, next to identical ones, in order to create a bearing framework for the equipped wall.
