Abstract (en)

[origin: WO2005047580A1] The invention relates to a method and a device for re-establishing a previously interrupted spinning process of a spinning device which comprises a drawing equipment that can be stopped and an low-pressure air jet unit, whereby a staple sliver supplied by the drawing equipment put back into operation is temporarily sucked off as waste once it has left the drawing equipment in order to remove an initially inhomogeneous fiber stream. Only when a homogeneous fiber stream is formed, the staple sliver is linked with a thread supplied through the air jet unit. The inventive method is characterized in that the inhomogeneous fiber stream is removed with the help of a negative pressure prevailing in the depression chamber.
