Abstract (en)
Identifying operator involves providing a radio frequency identification tag that comprises a memory module (32), where the memory module comprises identification data and a request to a control module is transferred over a contactless interface and identification data of a carrier is acquired. The identification data is compared within the memory module and identity of the carrier is validated by a verification module (33). Independent claims are also included for: (1) a system for identifying an operator (2) an implantable radio frequency identification (RFID) tag comprising a memory module.
