Abstract (en)
[origin: WO2005045996A1] Disclosed is an antenna booster (110) comprising at least one input (101) for connecting an antenna (100), at least one output (102) for connecting a receiver (120), and at least one means (112, 115) for adjusting the signal level between the input (101) and the output (102). In order to improve the signal-to-noise ratio especially in situations where a high-level noise signal is applied, a narrow-band filter (111) is disposed between the input (101) and the signal level-adjusting means (112, 115), the center frequency of the filter passband being modifiable and being tunable to the receive channel of the receiver (120).
