Abstract (en)
[origin: WO2005047035A1] A door arrangement such as a car door arrangement is characterized in that a light emitting device is placed on the rear side of the car door-with the car as a reference - or at some other well seen place, that the light signal may be combined with an acoustic signal, that in the process of opening the car door, the door is latched in a partially open position before the door can be finally opened, that the time during which the door is held in a partially open position is controlled by a control means, and in that the light emitting device is adapted to be activated when the door is in its partially open position.
