Abstract (en)

[origin: WO2005041504A1] A method and system for monitoring messages addressed to a first receiver (E1), comprising a first receiver (E1) which contains a first undesirable receiver device (UNE) and which prevents a user of the first receiver (E1) from accessing the undesirable receiver (UNE), wherein a message category is defined as undesirable, and messages which are to be prevented from being made available to a user of the first receiver (E1) are indicated. Verification occurs as to whether a message (M) addressed to the first receiver (E1) falls into the undesirable category. If the message (M) falls into the undesirable category, it is assigned to the undesirable receiver device (UNE). The first receiver (E1) is configured in such a way that the undesirable receiver (UNE) can only be accessed by a second receiver (E2). The first receiver (E1) is, for example, an e-mail account of a child and the second receiver (E2) is the e-mail account of an adult who can prevent the child from accessing undesirable messages, particularly Spam.
