Abstract (en)  
[origin: EP1688566A2] The lock includes a faulty operation bar lock (10) and a swivel sensor (19). The sensor sits for pivotal movement on a slider (21) which can be displaced transversely to the extension direction of the cover guard (5) and which has a release mechanism (31) for the locking member (22) and can be moved further inwards over the push position which is reached with the relevant swivel end position of the sensor. In the swivel end position one inclined flank of the sensor bears against the edge of the opening (20) and the other inclined flank forms a fall incline for a closing plate (44).
