Abstract (en)
[origin: WO2005053478A1] The inventive device (11) for suspending a handbag to tables consists of a U-shaped elastic ribbon (13) provided with a spring, in particular a coated steel spring. Said ribbon comprises a first tensioned branch (15) provided with a first end area (22) and a second outward curved branch (25) provided with a second end area (33) which is bent inside U. The second end area (33), in the closed position thereof, is guided around the first end area (22) and is applied thereto from outside by pressure, said first end area being tensioned. When said two branches are pressed against each other in such a way that the end areas are mutually applied, they are oriented in a parallel direction with respect to each other.
