Abstract (en)

A beverage dispense system (1) has a beverage source (2) connected to a supply line (12) that splits into two lines (14a,14b) upstream of a cooler (5) and the lines (14a,14b) are re-combined downstream of the cooler (5) for connection to a dispense tap (7). Splitting the supply line (12) enables flow rate through the system (1) to be increased with reduced velocity and minimal pressure drop so that break-out of CO₂ during dispense is suppressed.
