Abstract (en)

[origin: WO2005056344A2] A structural member for mounting in a lower region of a motor vehicle fender assembly extends in a longitudinal direction and has a cross-section designed in such a way that its spring characteristic under a bending load in a direction (x) substantially transverse to its longitudinal direction substantially matches a spring characteristic of a part of the fender assembly that is adjacent to the top side of the structural member (10).
