Abstract (en)  
[origin: WO2005050122A1] The invention relates to a trigger device wherein a spring-biased breechblock (46), by engagement with the feeder (11) of an ammunition magazine, can be displaced from a non-operational position in which the breech (48) is released into an operational position in which the breech (48) is maintained in an open position. The breechblock (46) has an actuator element (18) disposed on the trigger bow (12), which can be actuated with the shooting hand holding the grip (4) and the breechlock (46) can be adjusted from the operational position to the non-operational position, thereby releasing the breech (48). The direction of actuation of the actuator projection associated with the actuator element runs substantially perpendicular to the force pulling the trigger.
