Abstract (en)

[origin: WO2005060133A1] The invention relates to a circuit and associated method for synchronizing clock pulses, which enables, with a combined pulse spacing coding and pulse width coding, a simultaneous, collision-free, real time transmission of a number of plesiochronous reference clock signals on a bus line between network units, whereby the selection of the redundant reference clock pulses ensues without involving a central control unit that controls the first and second network unit.
