Abstract (en)
A snowboard with a handle is disclosed, wherein the snowboard (1) includes a gliding plate 2 having a gliding surface on its underside, the gliding surface having edges (21a, 21b) extending from the front end toward the rear end along the opposite lateral sides thereof, a rotary shaft (24) mounted on the upper side of the gliding plate (2) on its front side and having a central axis passing across the gliding plate (2), and a handle portion (3) disposed on the upper side of the gliding plate (2). According to the present invention, the handle portion (3) has grip portions (32, 32) on its top end, and has its bottom end mounted pivotally to the rotary shaft (24) so that the top end of the handle portion (1) on which the grips (32, 32) are provided can swivel upwardly and downwardly around the rotary shaft (24) by causing the bottom end to turn about the central axis. More specifically, the gliding plate (2) is designed such that the portion of the gliding plate (2) that extends from the point where the central axis passes across the gliding plate (2) toward its front end has the width that is smaller than the width of the portion of the gliding plate (2) that is located at the point where the central axis passes across the gliding plate (2) and such that the edges (21a, 21b) extending along the opposite lateral sides of the gliding plate (2) extend further toward the front end of the gliding plate (2) beyond the point where the central axis passes across the gliding plate (2).
