Abstract (en)

A single-direction door construction is provided with a door frame (22,24,26) having a vertically oriented hinge arrangement (50,52) which allows the door (21) to be opened in a first direction of rotation. Furthermore, the hinge arrangement enables the door to be opened in a second direction of rotation for use as an emergency passage. In particular, a combination of the door frame and a vertically oriented stop bar (32) fastened to the side of the door frame opposed to the hinge arrangement serves as an obstruction against opening in the second direction of rotation below a first pushing force exerted on the door, whereas above said first pushing force the stop bar (32) can be forced from its fastening in a reversible manner such that the obstruction is lifted.
