Abstract (en)

[origin: WO2005051104A1] The invention relates to a method for the preparation of multi-component mineral preparations, low in toxic material or free thereof, whereby plant or animal matter is used and at least two different, thermal-oxidative, physically separate processing steps are carried out. Mineral preparations produced thus are characterised by comprising essentially those minerals extracted from the earth by the relevant plant in a highly bioavailable form, whilst having a very low thermally-modified organic compound content. Trace elements which are a priori poorly soluble are thus preferably present in colloidal form, as a result of which the biological uptake is particularly good. Said mineral preparations far exceed the effect of currently available mineral preparations on health and fitness, as they also contain all those trace elements which can not be detected analytically, but which can have a significant energizing effect on the organism.
