Abstract (en)

[origin: WO2005054792A1] A vehicular obstruction location identification system, including one or more obstruction identifier module (1), a central control unit (2) and a remote control unit (3), all of which are in communication via communications devices (8, 11, 13), to identify the location of an obstructing vehicle. One or more obstruction identifier module (1) is placed anywhere locally, nationally or globally, each of which, on sensing an obstructing vehicle, automatically generates a code containing at least a unique identifier and then communicates the code to a central control unit (2) via communications devices (8, 11). On receiving the aforementioned code, the central control unit (2) automatically looks up the location of the obstructing vehicle in a database (10). The central control unit (2) communicates the location of the obstructing vehicle via communications devices (11, 13) to a remote control unit (3).
