Abstract (en)

The method involves associating a rotation speed sensor (12) to a hydraulic motor (1) and providing a control loop for operating the motor at a minimum drag airspeed. The motor is supplied with a pressurized liquid by a hydraulic control system. A rotation speed of the motor is reduced at the airspeed during a preset period and then from the airspeed to a maximum cleaning speed, in a reverse rotation direction of the motor. An independent claim is included for a system implementing a method for controlling a hydraulic motor reverse rotation direction.
