Abstract (en)

The bearing has a support block formed in a frame of a timepiece. The support block is provided with a recess provided to receive a spring with axial and radial deformation. A setting carries a pierced stone (4) through which a pivot-shank passes and an end stone (5). The spring is formed in a single piece of a peripheral ring, where the pierced stone and the end stone are assembled in the setting suspended by the spring. An independent claim is also included for a method of manufacturing a shock absorber bearing.
