Abstract (en)

[origin: EP1696629A1] A technique for providing one class of users of an application a view of what a typical user in another class of users of the same application is visually experiencing is provided. A client application that is interacting with the application provides a user an option of having a PIP view of what a typical user in one of the other classes of users supported by the application is visually experiencing. When the user requests to display a PIP view that represents what a typical user in a specified one of the other classes of users of the same application is seeing, a PIP view window is automatically rendered on the user's display screen. The PIP view window represents what a typical user in the specified one of the other classes of users is seeing, but is not an "active" interface through which the user can interact with the application.
