Abstract (en)

[origin: US2009015682A1] The invention relates to an anti-glare device comprising a camera, a visualisation means for reproducing a processed image, and an adaptable filter comprising a filtering image controlled by the camera, said image containing masking regions which obscure the dazzling regions. The inventive device is characterised in that it comprises a single camera provided with an output connected to an electronic circuit which controls the filter for the alternate display of an acquisition image and a filtration image calculated according to the image transmitted by the camera during the previous acquisition phase. The invention also relates to the method implemented by one such device, and to an accessory for a photographing device.
