Abstract (en)

The rotary packing slide (8) includes planar resting surfaces (11). When this slide turns from the release position into the extraction position (10), these rests (11) contact similarly plane-faced support surfaces in the packing slide recess (13). A notional line (16) from the rotary slide axis (15) touches the leading edge of each of its rests. This line makes an angle of at least 90[deg], especially 92-95[deg], with the resting surface.
