Abstract (en)

[origin: EP1699030A1] The method involves causing a maintained execution of a corresponding command by an actuator with an electric supply. The power supply of the actuator is stopped during the reception of a frame containing a specific command different from a stop command, and the absence of the reception of frames during time duration longer than that of a securization time-out. The maintained execution of the command is caused by a repeated transmission of frames containing a movement command and the reception of the frames. An independent claim is also included for an installation for the control of a movable unit of a shading device, projection unit, ventilation unit or closing unit in a building.
