Abstract (en)

[origin: WO2005065835A1] A method and device for preventing blockages in the flow paths of a separator during the processing of a fat-containing initial product, particularly milk, determine, in order to identify an impending blockage, the concentration of the fat content of an outflowing product phase. When a predetermined fat content limit value is reached or exceeded, the separating zone in the separator drum is then shifted away by modifying the operating parameters whereby preventing a blockage over a predetermined minimum period of time.
