Abstract (en)

[origin: WO2005012128A2] The invention relates to a food container (100), in particular for serving, storing, cooling, reprocessing and transporting food, essentially comprising two container parts, in particular a lid part (105) and a base part (103) and a sealing component (107) for sealing at least one of the two container parts. A compensation device (120) co-operates with the sealing component and the two container parts in such a way that the position and/or the contact pressure of the sealing component can be adapted in relation to at least one first container part, in particular the base part and/or at least one tray (109) that is located or suspended in said base part, in order to compensate for leakage and to seal off the food contained in the base part and/or the tray from the exterior. The invention also relates to a system for transporting, serving, storing, cooling and reprocessing food using the inventive container and to a method for sealing said container.
