Abstract (en)
[origin: WO2005066055A1] The invention relates to a yarn tension device (F) having a fixed tensioning surface (1) and a moving tensioning surface (2) and having yarn guiding elements (L1, L2, 8), which define the yarn path (x) through the yarn tension device (F) while situated upstream and downstream from the fixed tensioning surface (1). According to the invention, at least the upstream yarn guiding element (L1, 8) is, in the tensioning position, shifted downward so that it is off-center relative to the upper side of the fixed tensioning surface (1), and the yarn tension device comprises an adjusting device (SF) with which the relative position between the fixed tensioning surface (1) and at least the upstream yarn guiding element (L1, 8) can be altered in directions essentially perpendicular to the fixed tensioning surface (1).
