Abstract (en)

[origin: FR2864282A1] The method involves associating a description having conjunction of related attributes, with alarms from intrusion detection probes (11a-11c). The attributes are organized into taxonomic structures defining special relation between the attributes. The description of each alarm is added to previous alarm, using values established by the structures. The added alarms are stored in a logical file system for analysis of alarms. An independent claim is also included for a computer program of implementing a method of managing alarms by an alarm management system.
