Abstract (en)  
[origin: WO2005058502A1] The invention relates to a disc mill having two substantially parallel grinding discs (2, 3) that are configured as annular discs having a center passage (4) and that have opposite working surfaces (9, 10). These working surfaces are spaced apart from each other, thereby forming a working chamber (11) in the area of the passage (4), and converge outwards, thereby tapering the working chamber, and rotate in relation to each other. The inventive disc mill is characterized in that the working surfaces (9, 10), in an outer edge section (12), are configured in parallel and with an at least slight distance to each other.
