Abstract (en)

[origin: US2006207284A1] In order to flush with cooling air the goods stacked or palletized in a high-bay rack placed in a stationary store room or in the cargo space of a refrigeration ship by maintaining a constant cooling temperature in all the layers, an air recirculation system is proposed for which two superimposed air circuits (40, 140; 40', 140') are configured in the area of every rack module (30; 130), whereby at least one rack module, preferably two rack modules (30; 130), are placed in the cargo space and whereby a shaft (50) for the rack stacker is assigned to each rack module (30; 130) or a shaft (50) for the rack stacker is placed between the two rack modules (30; 130) placed the one besides the other, whereby the shaft (50) serves a common pressure distribution chamber of the inlet air for each rack module (30; 130).
