Abstract (en)

[origin: EP1703753A1] The method involves collecting characteristic network operation variables in cells (C1-C14) of a cellular mobile communication network. Each variable is provided in association with the cell by selecting a continuous line (30) progressing on a network map through adjacent cells. The variables for the adjacent cells traversed by the trace are arranged according to a structured representation and based on the order of the line. Independent claims are also included for the following: (1) a workstation for analyzing the operation of a cellular mobile telecommunication network comprising a set of cells (2) a computer program for a workstation comprising a set of instructions for the execution of stages of a cellular mobile telecommunication network's operation analyzing method.
