Abstract (en)

[origin: WO2005058013A1] The present invention relates to the harvesting of plant parts of a plant. A stem of the plant is connected to a suspension structure, the stem substantially having a vertical direction. The stem and a positioning member are positioned with respect to one another by moving the stem and the separating member with respect to one another. In the process, the positioning member and the stem are brought into contact with one another. Then, a plant part which is hanging from the stem is separated from the stem using a separating member.
