Abstract (en)
[origin: WO2005068336A1] The invention relates to a folding device in a rotary roller press machine, which comprises a cutting cylinder (127') and a transport cylinder (123) interacting with said cutting cylinder in the form of a counter bearing, and receiving product sections. The cutting cylinder (127') comprises four successive blades (128) which are arranged in the region of the covering surface thereof in a direction of the periphery and the transport cylinder (123) comprises seven successive retaining devices (129) in the region of the covering surface thereof in a direction of the periphery.
