Abstract (en)

A cradle comprises a container (H,K) in which a baby can lie. A first side of the container is open or has a side panel which is capable of being displaced to allow access to the container (H,K) when the cradle is positioned alongside a parental bed. The cradle is supported at an adjustable height above a floor surface. The container (H,K) has a nose (F) portion which is positioned along the first side of the container and which protrudes outwardly from the container. The nose portion (F) can press firmly into a mattress of the parental bed and ensures that there is always a continuous bridge between the baby's mattress (G) and the parental bed. The container (H,K) is in the form of a carry cot which can be detached from the support structure (A,B,C).
