Abstract (en)

The wheel has a felloe (1) with two counter sinks (4), in which adjusting masses (8) are mounted. Each counter sink has two lateral walls (5) parallel to a radius of the wheel. A guide pin (6) is located on an axis of symmetry of each sink and projects from a side of the wheel having the counter sinks. Each mass has a cylindrical outer wall cooperating with the lateral walls of the sink and a spiral opening (9) with constant or variable step, receiving the pin. Diameter of the pin is larger than the width of the opening so that the mass is maintained on the pin.
