Abstract (en)

[origin: WO2005071621A2] The invention relates to a programming device for programming transmitter/receiver systems for contactlessly actuating doors and gates. In order for a transmitter/receiver system to actuate a door or a gate, a transmitter code is read into an assigned receiver and compared with a receiver code therein. The inventive programming device comprises a computer unit for managing the transmitter codes and the receiver codes of the transmitter/receiver systems. In addition, the inventive programming device contains an input unit for defining the transmitter codes and receiver codes of the transmitter/receiver systems. The programming device also comprises an interface unit, which is provided for connecting transmitters and receivers and via which receiver codes can be output to connected receivers and transmitter codes can be output to connected transmitters. For each transmitter/receiver system, transmitter codes for its transmitter are defined in the computer unit in the form of subsets of the receiver codes of its receiver.
