Abstract (en)

The device has a chamber (5) delimited by a closing unit (4) connected to a container (2) through an intermediate piece (3). The unit is passed, in response to activation control, relative to the piece from a configuration in which the container and chamber are isolated to another configuration in which the container and chamber are communicated. The piece is removable relative to the container and has a tubular channel (21) communicating with the container. The unit has a sealing body (6) around which the chamber is defined, where the body seals the container prior to the activation control. An independent claim is also included for a method for conditioning a cosmetic products mixing device.
