Abstract (en)
[origin: FR2865381A1] Intraocular implant comprises a circular optical part made of flexible material and two handles that are not made of polymethyl methacrylate. Each handle has a straight inner section attached at one end to the optical part, a middle section, and a curved outer section for contact with the wall of the eye. The middle section is straight in projection on the optical plane but forms a dog-leg in the direction of the optical axis so that the inner and outer sections are parallel to each other.
