Abstract (en)

[origin: WO2005073071A1] What is disclosed is a vessel (2) comprising a supporting structure (13), a superstructure mounted thereon, which is provided with vessel operating and control elements (4), and a movable canopy (5). The canopy (5) is adjustable at least in vertical direction, but preferably also in transverse direction or longitudinal direction. By making the canopy vertically adjustable, a vessel is obtained that makes it possible to combine the advantage of a vessel having a lower superstructure and, in view of the amount of headway that is on average required, a larger radius, with the advantages of a higher degree of comfort, for example because more headroom is available for the passengers, in particular in the wheel house part of the covered superstructure of the vessel. The same controls (4) can be used in that case both for navigating inside and for navigating outside.
