Abstract (en)

[origin: WO2005073116A1] To the side of a plane of conveyance for the path of the objects (3) into the stacking compartment, one or more hook-shaped elements (1) for diverting and supporting the, with regard to the direction of movement, rear portions of the larger objects (3) are placed one above the other in the direction of the stack support (10) and are fastened at one end to a shaft (13) driven in a controlled manner. When an object (3) is entering the stacking compartment, a sensor signal generated by the front edge of the entering object (3) is released. The hook-shaped element(s) (1) is/are oriented in such a manner that the object (3) enters the hook-shaped element(s) (1) and, at the same time, the rear edges of the large objects of the stack (7) are kept out of the insertion channel. The hook-shaped element (1) is, insync with the movement of the object, swung out from the plane of conveyance whereby enabling the object (3) to enter the stacking compartment without being obstructed.
