Abstract (en)
[origin: WO2005073466A1] The invention relates to a highly elastic electrically insulating support point for the rails of a rail-guided vehicle with an anchorage in a supporting construction and spring-loaded fixing of the foot of the rail by means of a plate for lateral guidance of the rail foot and a screw which penetrates a spring on two sides of the foot of the rail which lies on an elastic base and said base lies on the supporting construction. An anchorage, consisting of a plastic bushing which is integrated into the supporting construction and which surrounds a screw bolt, is respectively arranged on both sides close to the foot of the rail, whereby the threaded end of said screwbolt protrudes from the anchorage to the side of the rail. A set of several superposed plastic plates, which are wider than the foot of the rail and accompanying spring-loaded fixing mechanism, is arranged between the supporting construction and the foot of the rail. The upper plate thereof is embodied in the form of a bearing element for the foot of the rail. At least one plate is embodied such that it is elastic and that it can be readjusted in order to lower the foot of the rail in a predefined manner and all plates have openings for the threaded end, whereby a nut for spring-loaded bracing of the foot of the rail can be placed thereupon. A kit for the support point and as a complement thereto a method for production of a support point for a fixed travel path comprising one such kit are also provided.
