Abstract (en)

[origin: US2005153775A1] A gaming apparatus may include a display system, a value input device and a controller operatively coupled to the display system and value input device. The display system may include a first display unit, a second video display unit disposed in front of the first display unit and a light valve disposed between the first and second display units. The second display unit may include an opening. The controller may include a processor and a memory operatively coupled to the processor. The controller may be programmed to cause the display system to generate a game display on the first display unit, cause the light valve to become substantially transparent so that the first display unit is visible through the opening, cause the display system to generate a video display on the second display unit, and determine a value payout associated with an outcome of the game.
