Abstract (en)
[origin: CA2541503A1] An air-cooled condenser (1) for the condensation of steam by means of air is described, said air-cooled condenser comprising a steam supply line (2), at least one upwardly directed pipe bundle (6), to which the steam to be condensed can be supplied, a condensate drain for the drainage of condensed steam and a fan (11) for the air transport to the pipe bundle (6). The pipe bundle (6) is arranged below the fan (11) in a sidewall (18) of the air-cooled condenser (1). Several pipe bundles (6) are thereby arranged in such a way that they form a jacket (13) in the form of a polygon extending in the plumb line, wherein said jacket is closed such that it forms an enclosure on all sides.
