Abstract (en)  
The present invention provides a flat tube to be used in a heat exchanger that allows the heat exchanger to be provided as a compact unit and can be used as a universal part. The present invention also provides a heat exchanger that includes such flat tubes and a method for manufacturing the flat tubes. In flat tubes 5 and 6 each formed in the shape of a flat tube with two open ends and a fluid passage formed therein and having twisted portions near the open end portions 13 and 14 and open end portions 13 and 14 inserted at tube insertion holes 7 or 8 and 12 ranging along the central lines of a header pipe 2 or 3 and a header pipe 4, the open end portions 13 and 14 of the flat tube 5 (6) are offset relative to the central line of the flat tube extending along the length thereof to a specific extent so as to align the open end portion 13 (14) with a side edge of the flat tube 5 (6). This structure allows the heat exchanger to be provided as a compact unit and the flat tubes can be offered as universal parts.
