Abstract (en)

[origin: WO2005075019A1] The invention concerns a device for therapeutically treating a patient using magnetic fields, particularly with nuclear magnetic resonances. The aim of the invention is to provide a device for treating a patient using magnetic fields, with which, in particular, a localized treatment, e.g. in the head area of the patient is made possible, which burdens the patient as little as possible, and which can be used in a space-saving manner. The device should also be able to be versatily adapted to the anatomy of the patient and/or to the clinical picture. According to the invention, the device has a backrest and at least one first extension member (4B), which projects from the plane defined by the backrest (1C), and a device (30B) for generating the first magnetic treatment field is mounted on the first extension member (4B). In a particularly preferred embodiment, the device is provided in the form of a treatment seat or chair.
