Abstract (en)

[origin: WO2005075327A1] The invention concerns a continuous rolling machine for web materials comprising two independent driving rolls (4 and 5) co-operating with a take-up reel (3A, 3B) and a winding method with controlled application load of said driving rolls. Said machine is characterized in that at least one of the driving rolls of the winding device (2) is in contact with the take-up reel (3A, 3B), from the start of the phase for preparing a new reel (3A) until the finished reel has completely stopped, one (4) of the driving rolls being in contact with the reel soon after the start of the latter's (3A) formation and until the finished reel has completely stopped (3B), the other driving roll (5) being in contact with the reel from the start of the latter's (3B) formation until its release (3B), prior to connecting a new reel.
