Abstract (en)

[origin: WO2005057106A1] A COOLING DEVICE This invention relates to a cooling device that comprises a door opener mechanism (4) through which the user can have access to the inside of the body (2) by opening the door (3) with little effort, though it is difficult to open it because of the vacuum generated during the refrigeration cycle as a result of the pressure difference between the interior and the surroundings of the body (2) and because of the magnetic gasket located between the body (2) and the door (3).
