Abstract (en)

[origin: EP1712301A2] The device has a container (18) to collect wire pieces (15) loosened from a textile lining (13) in an overhanging position of the lining. The lining is a circle-cylindrical superficies of a barrel (11) and is rotatably supported at the barrel around its axis. The lining is moved with a motor (10) and a belt (19), where an upper surface of the surface is formed by a fiber layer. The wire pieces are stuck in the upper surface. An independent claim is also included for a method of separating and extracting pieces of wire from hackled electronic scrap iron.
